

Signing up for Essential Websites for POLI3148

Hi! Welcome to join us in this course. You've made a great enrollment choice. Before we get started, there are some services that are essential to our course and need you to sign up for. Please read through this guideline and complete the registrations step by step. Skip ones that you are already using.

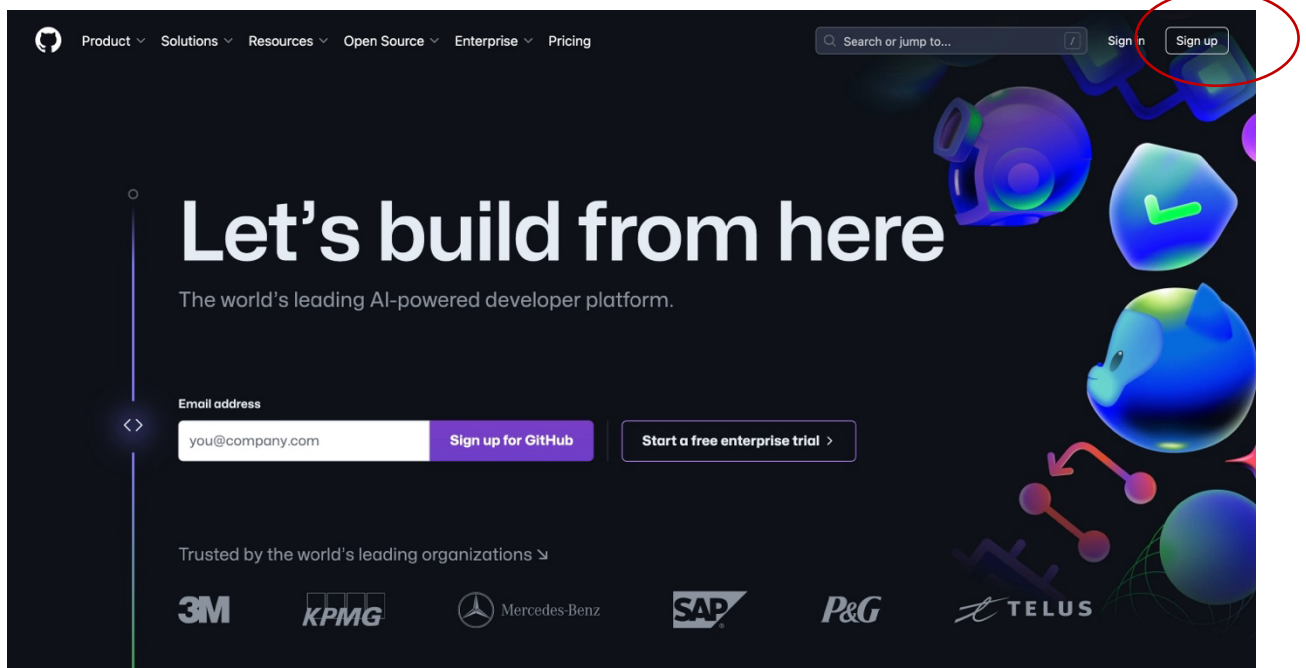

1. Google Collab

Go to <https://colab.research.google.com/> and login your personal Google account.

2. GitHub

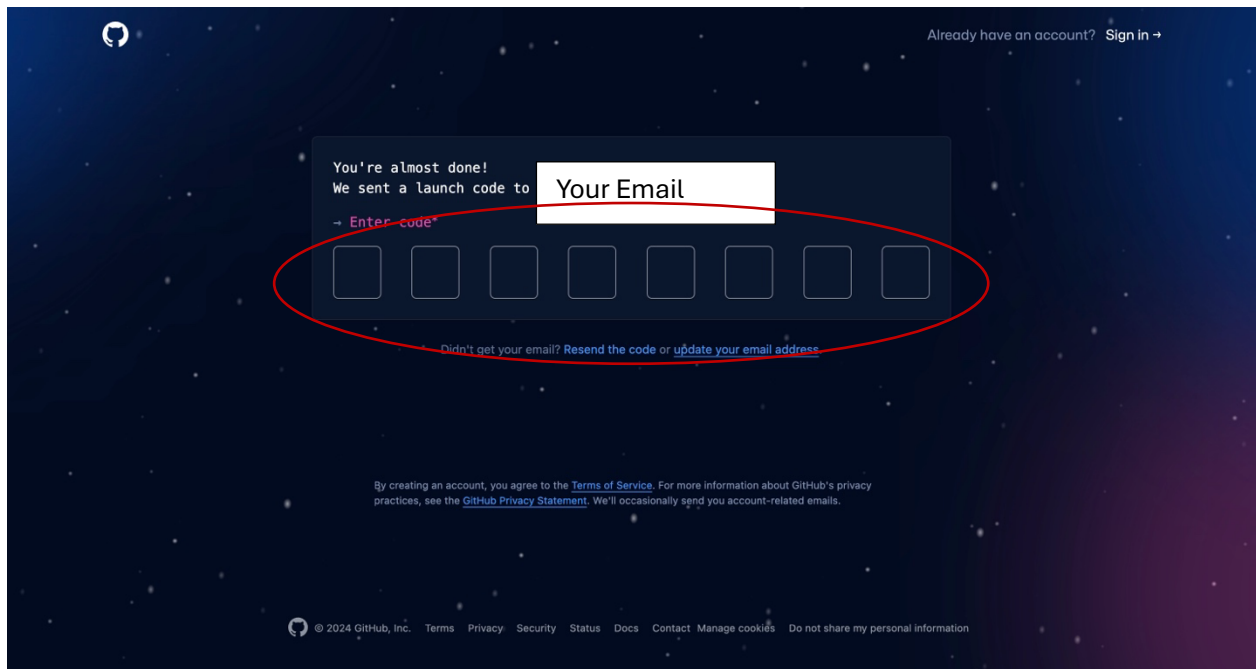

GitHub is where you store, back up, and share your code in repositories with peer programmers and developers, which makes your programming open-source. After you make changes to codes on your local machine, the version control system (Git) built in GitHub Desktop will automatically detect changes, and you may commit those changes to GitHub. We might not use GitHub as extensively as many other professional developers do but it will be useful when you become more proficient in programming. Google "What is GitHub and how to use it" for more uses of GitHub. To sign up for GitHub, you'll need a valid email address. HKU email is already enough. So, let's get started.

First, go to <https://github.com> and hit "Sign up" at the top right corner.

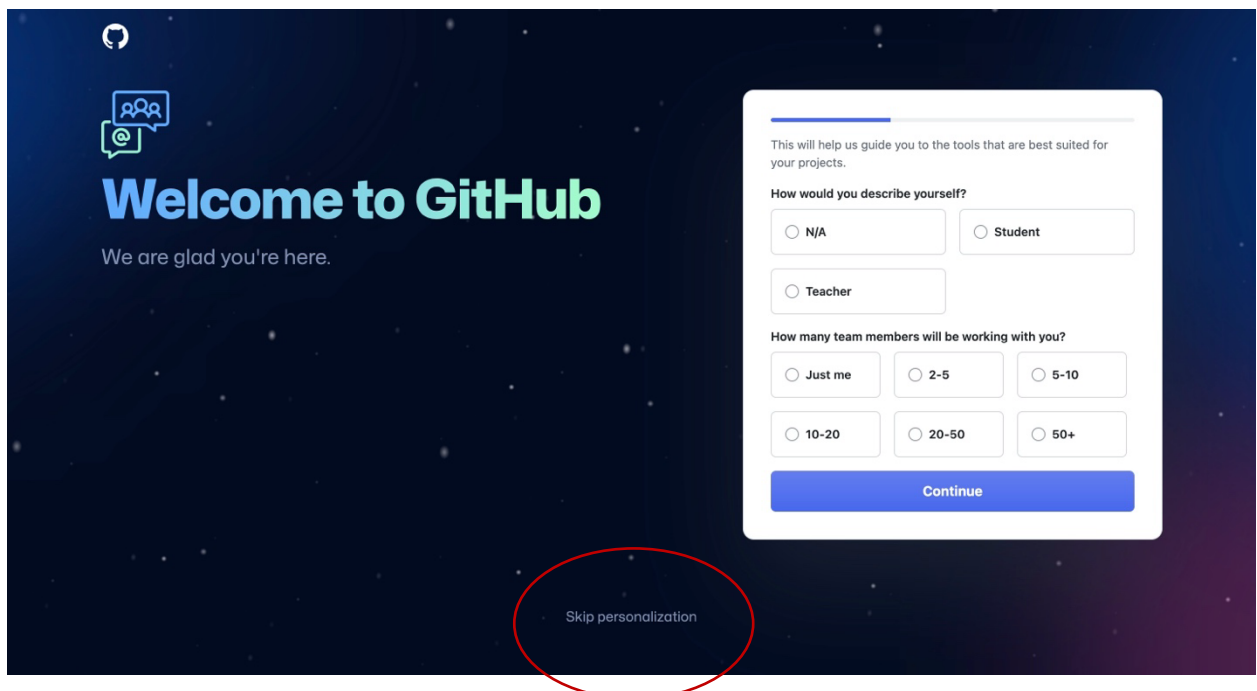

Enter your email, create a password and username as instructed. Note that username may only contain alphanumeric characters or single hyphens, and cannot begin or end with a hyphen. Hit "continue" to, well, continue. Solve the puzzle and verify you're a real

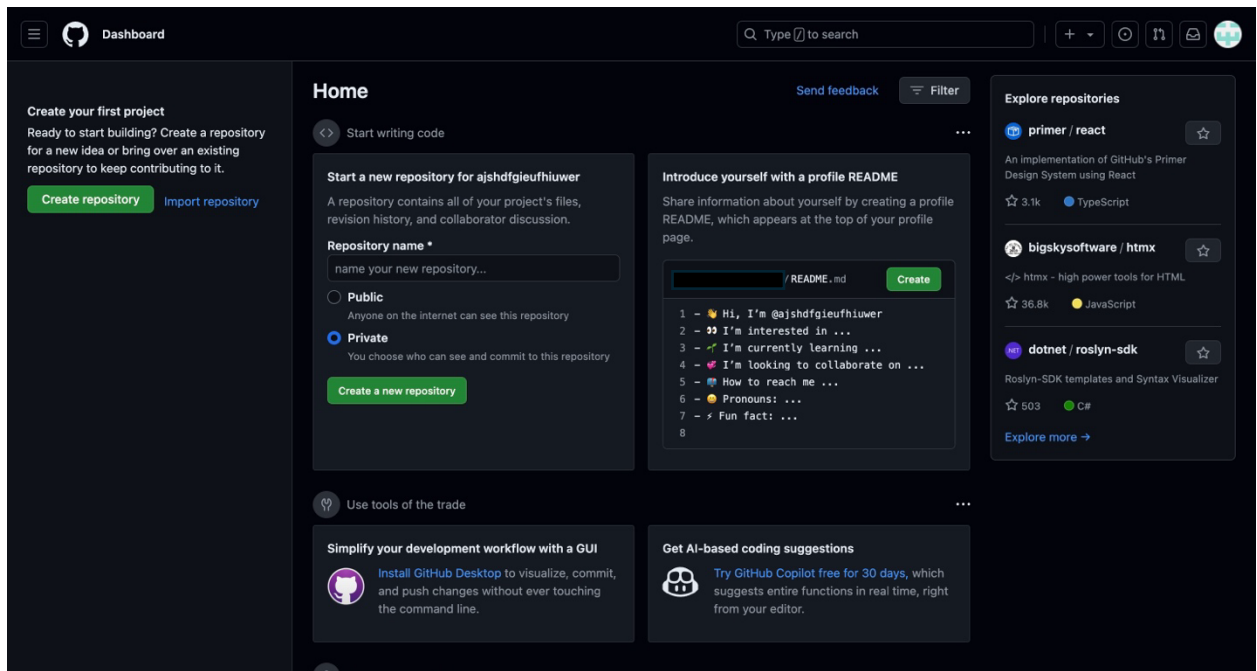

person when prompted to do so. You will receive a registration confirmation email from GitHub, type in the codes to activate your account. If you did not get the email, do check your junk folder.

Now log in and skip the personalization questions as you wish.

Tada! It's all good If you see this:

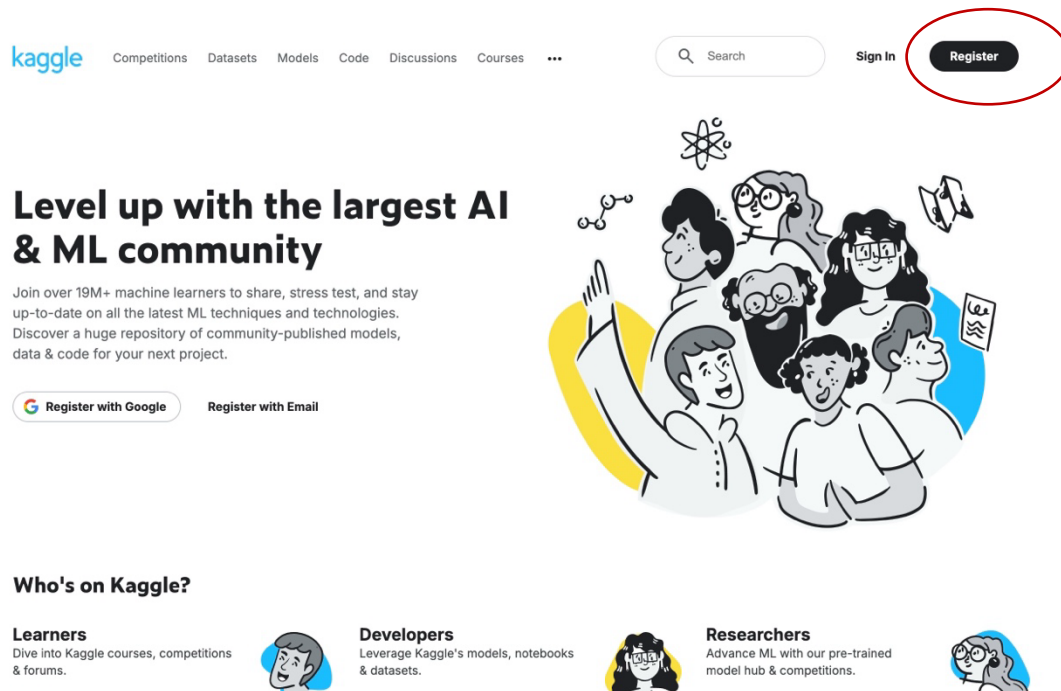

Feel free to click around and see what's the deal with this platform.

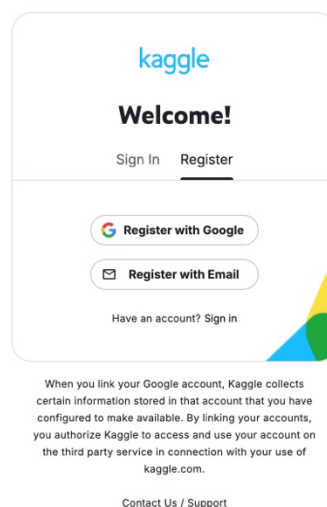

3. Kaggle

Kaggle is a very powerful platform too. People use it to compete their machine learning strategies for some prize (tiny prizes sometimes, like T-shirts and cups). It also has some free datasets that can be downloaded to analyze. If you are looking for datasets for your final project, Kaggle might have some for you. We are mainly using it so that you can learn by yourself to check some boxes. Later on we will also link Kaggle to Google Collab and GitHub.

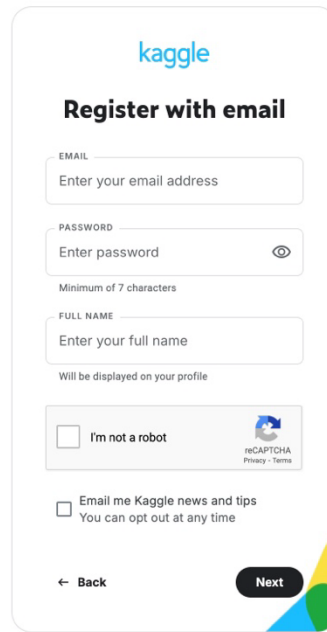

First, go to <https://www.kaggle.com/> and hit “register” at the top right corner.

Choose either “Register with Google” or “Email”. This time we go with Register with Email.

Type in your email and full name, create a username and a password. Complete the Captcha to verify you are a real person.

The registration form is titled "Register with email" and features the Kaggle logo at the top. It contains four input fields: "EMAIL" with the placeholder "Enter your email address", "PASSWORD" with the placeholder "Enter password" and a minimum length requirement of 7 characters, and "FULL NAME" with the placeholder "Enter your full name" and a note that it will be displayed on the profile. Below these is a reCAPTCHA checkbox labeled "I'm not a robot" and an option to "Email me Kaggle news and tips" with a note that users can opt out at any time. At the bottom, there are "Back" and "Next" buttons. A decorative yellow, blue, and green triangle is in the bottom right corner.

Type in the codes you receive to activate your account. Check your junk folder if you did not get the email.

The verification form is titled "Verify your email" and features the Kaggle logo at the top. It includes a message: "We've sent you an email with a six-character code. Please enter it here." Below this is a "SIX-CHARACTER CODE" input field containing the text "GWptfG". At the bottom, there are "Resend email" and "Next" buttons. A decorative yellow, blue, and green triangle is in the bottom right corner.
